Piezoresponse Force Microscopy

PFM Tutorial Workshop. August, 26

NT-MDT: History and Background

- The oldest AFM manufacturer in the world
- Two-time R&D100 AWARD winner.
- The second position of global AFM manufacturers
- 250 experts in HQ offices

NT-MDT: Experience + Innovations

NT-MDT has achieved high results in **Piezoresponse Force Microscopy** technique development due to careful attention to the trends in the world of scientific research.

The Basic Idea of Piezoresponse Force Microscopy (PFM)

Step 1

Polarize the piezoelectric sample locally applying the electric potential

Step 2

Analyze the response

PFM is a Perspective Mode

PFM since its inception and first implementation has steadily attracted more and more interest.

It can be applied in various fields:

Ferroelectrics

Semiconductors

Biology

PFM image of a z-cut ferroelectric single crystal

Hexagonal domain structure of Lithium Niobate

Image courtesy of T. Jungk, A. Hoffmann, E. Soergel, University of Bonn.

PFM is a Standard Mode of NT-MDT Equipment

PFM mode is implemented in each product of:

NTEGRA Platform

SOLVER Platform

By Default!

NT-MDT meets the wishes of PFM researchers

Probes

DCP11

Tip with diamond-like
extra-stable coating

CSG01/Pt

High Resolution CONTACT "GOLDEN"
Silicon Cantilevers CSG01 series with
PtIr conductive coating

PFM Capabilities

Domain imaging

Topography image

Piezoresponse image

Switching spectroscopy mapping

Ferroelectric properties of the P(VDF-TrFE) nanostructures*

Domain lithography

Source: Regular arrays of highly ordered ferroelectric polymer nanostructures for non-volatile low-voltage memories. Zhijun Hu^{1,2}, Mingwen Tian³, Bernard Nysten^{1,2} and Alain M. Jonas^{1,2}

PFM capabilities

Temperature dynamics
and phase transitions

Spectroscopy

Thermal Control

Operation temperature range: from -20 °C to +300 °C

Peltier

300 °C heating stage

150 °C heating stage

Piezo Hysteresis Spectroscopy

Measurements by steps

Measurements by peaks

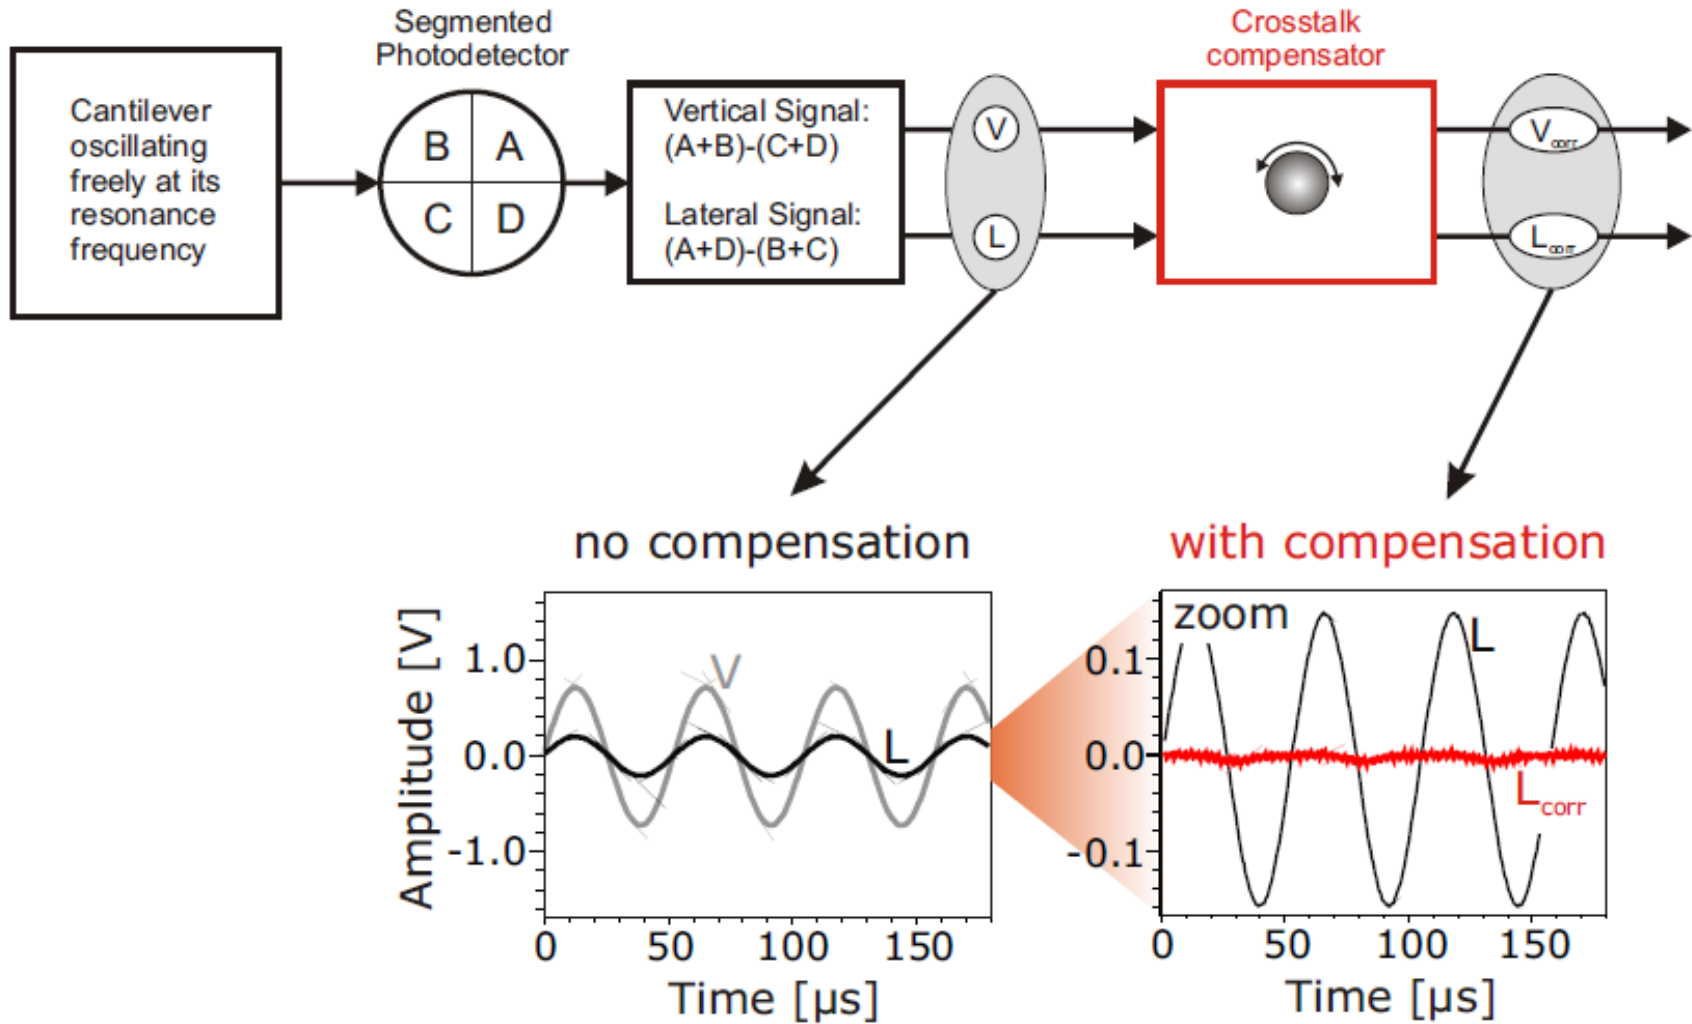

Hysteresis loop on a microscopic scale (within a single domain)

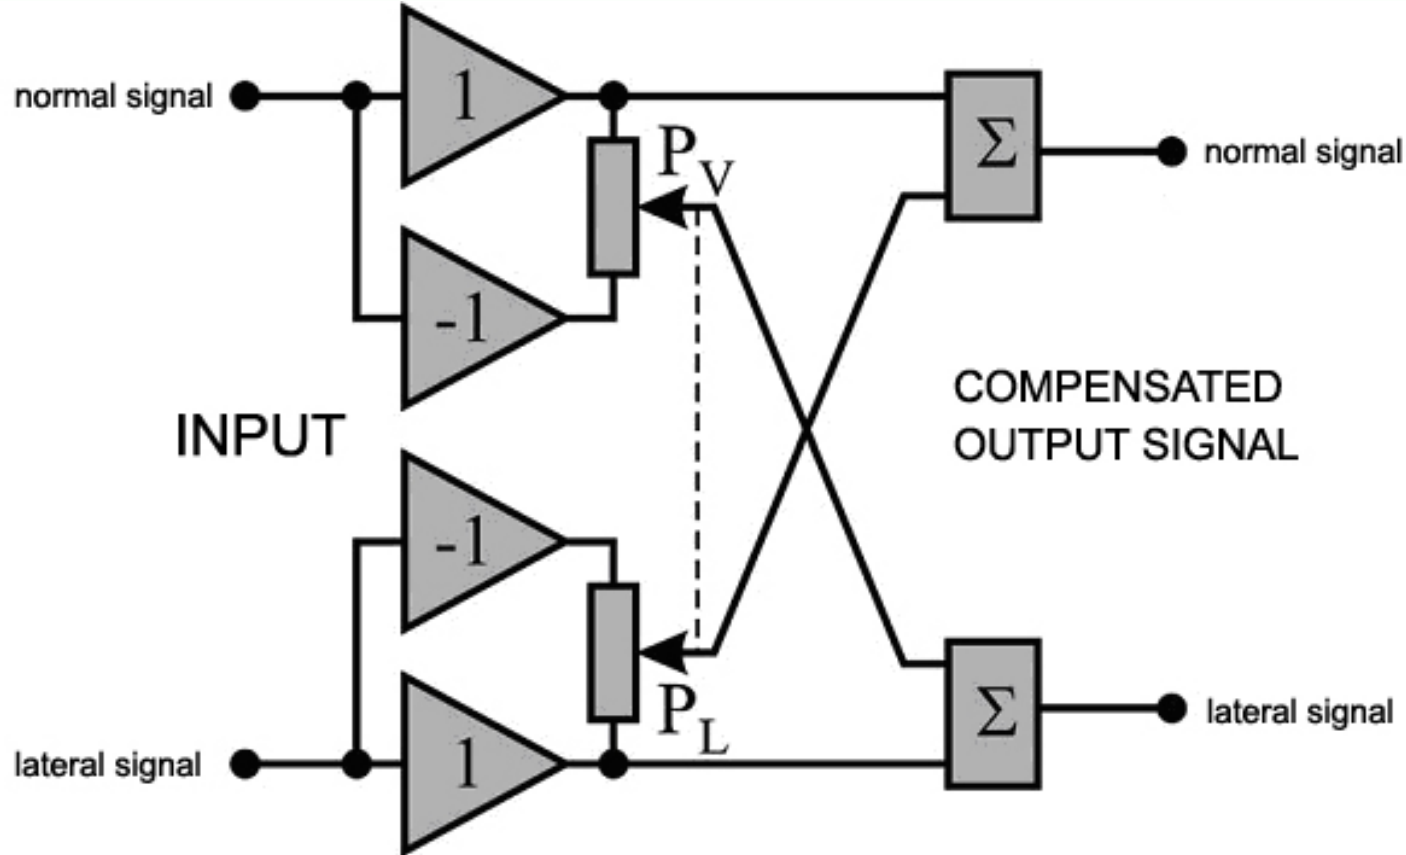

Hysteresis loop on a macroscopic scale

Note: the definitions of the spontaneous polarisation P_S , the remanent polarization P_r , and the coercive field E_c

Principle of Crosstalk Compensator

Basic Diagram for Crosstalk Compensator

P_L, P_V - potential dividers, Σ - adder

Compensated signals:
$$\begin{bmatrix} V_c \\ L_c \end{bmatrix} = \begin{bmatrix} 1 & -x \\ x & 1 \end{bmatrix} \begin{bmatrix} V_m \\ L_m \end{bmatrix} = \frac{1}{\cos a} \begin{bmatrix} V \\ L \end{bmatrix}, \quad x = tga$$

Crosstalk Compensator Operation

Experiment with peptide nanotubes (high in-plane signal):

Topology

Amplitude
(vertical)

Amplitude
(lateral)

Left part of images:
with compensator

Right part of images:
without compensator

frequency 125 kHz,
amplitude 10 V

Crosstalk Compensator Operation

Experiment with TGS crystals (high out-of-plane signal):

Left part of images:
with compensator

Right part of images:
without compensator

Topology

Amplitude
(vertical)

Amplitude
(lateral)

frequency 30 kHz,
amplitude 5 V
T=45 C° (after 60 C°)

Crosstalk Compensator

The Compensator eliminates the crosstalk effect

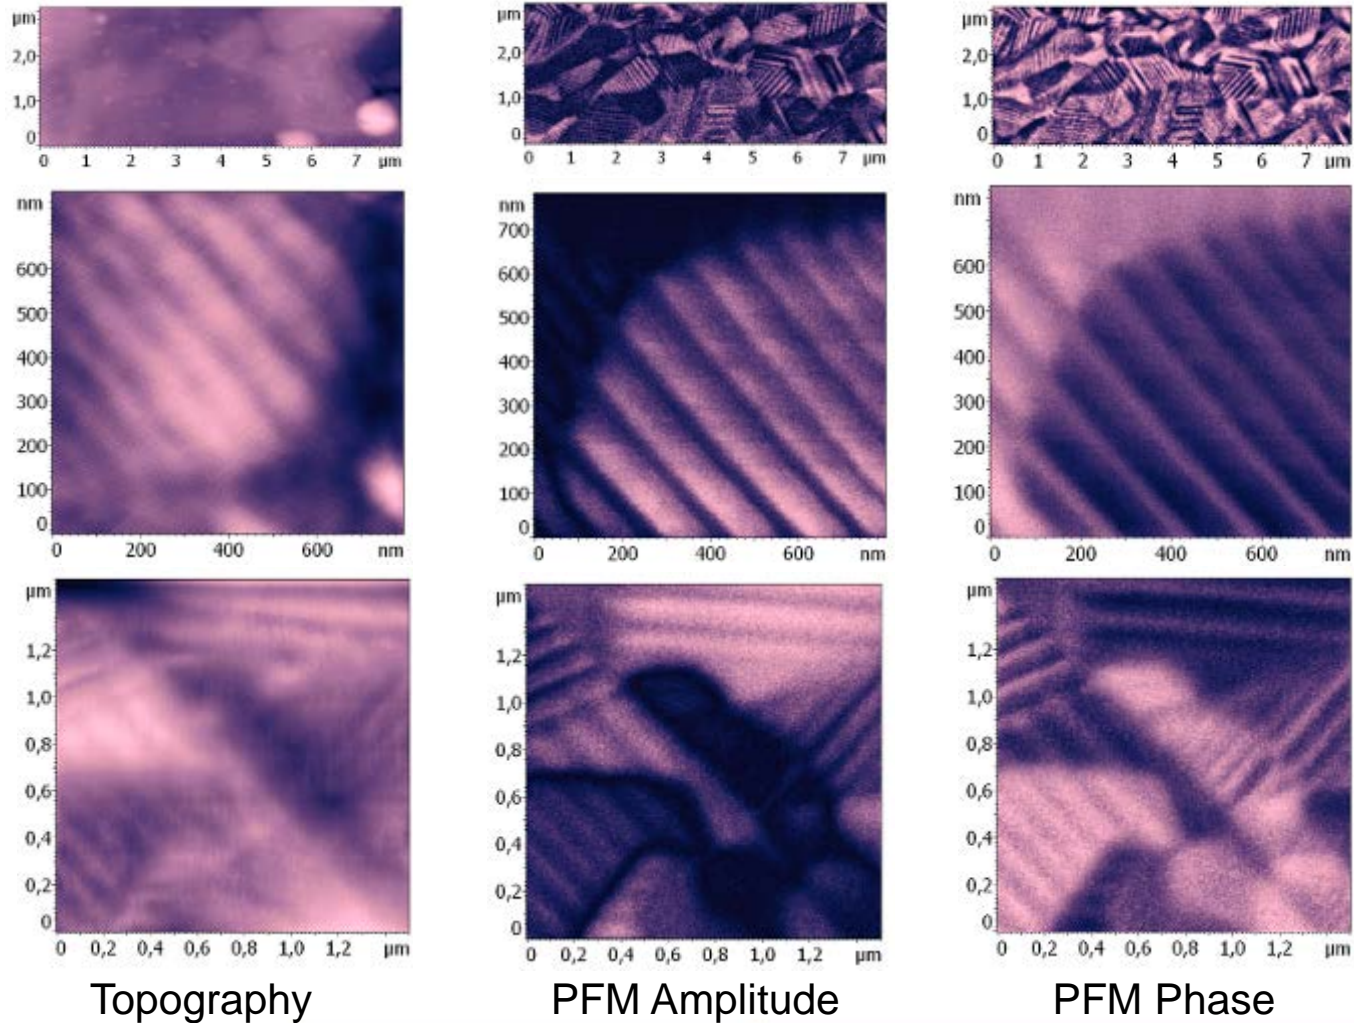

NT-MDT Crosstalk Compensator

Measurement Results

PFM : PZT High Resolution
