HiPace® 80 Neo

The hybrid bearing turbopump with Laser Balancing™ technology.

Extended thermal working range

Your added value

Durable and safe

Patented Laser Balancing Technology

Thanks to the innovative laser balancing technology patented by Pfeiffer Vacuum, the HiPace 80 Neo has the lowest vibration level on the market as well as minimal noise emission. As a result, it offers the highest precision and is excellently suited for vibration-sensitive applications.

Excellent temperature management

The integrated rotor temperature measurement system ensures that the HiPace 80 Neo delivers the best performance for your application at all times. With a housing temperature of up to 80 degrees, the thermal working range can be utilized to the maximum. Due to the integrated sensor system, HiPace turbopumps ensure maximum safe operation.

Robust bearing for optimum reliability

The hybrid bearing of the HiPace 80 Neo consists of an oil-lubricated, ceramic ball bearing on the fore-vacuum side and a permanent-magnet radial bearing on the high-vacuum side. As a result, this turbopump from the HiPace series has a particularly robust bearing that ensures excellent reliability.

**Lowest operating costs
due to innovative design**

**Easy commissioning and
intelligent functions**

**Maximum precision
thanks to patented
Laser Balancing
technology**

**Ultra-compact design
with maximum
performance**

**Robust bearing for
optimum reliability**

Compact design and smart functions

The HiPace 80 Neo offers high performance while taking up minimum space. Smaller, more compact and lighter than other turbopumps, it can be integrated into portable and mobile applications. It is ultra-compact and smart at the same time: Thanks to its micro USB interfaces with automatic accessory recognition, the system can be quickly up and running in just a few steps.

Durable, cost-effective and virtually maintenance-free

The HiPace 80 Neo is equipped with a new high-performance lubricant that guarantees additional safety and reliability for your application thanks to improved ageing resistance, enhanced lubrication behavior, higher temperature resistance and reduced outgassing. Continuous filtration of the lubricant results in more cost-effective maintenance, and maintenance-free operation for up to five years.

Applications

- Stationary, mobile and portable mass spectrometry
- Electron microscopy
- Leak detectors
- RGA systems
- Accelerators
- Plasma cleaning
- 3D printing
- Load lock applications
- Helium dilution

HiPace® 80 Neo

with patented
Laser Balancing™ technology.

Pfeiffer Vacuum is the developer and patent holder of the pioneering Laser Balancing technology.

Excellent balancing

The rotor of a HiPace turbopump runs at up to 90,000 revolutions per minute. A jumbo aircraft engine, in comparison, operates with a maximum of just 30,000 revolutions per minute. At such speeds, the slightest imbalances, in the range of just a few milligrams, can have a major impact on the operation of the pump.

Good balancing is therefore relevant both for the smooth running of the rotor and for years of damage-free operation of the turbopump. It also reduces the vibrations transmitted to the vacuum chamber and to the customer's application.

The revolution of balancing

Laser Balancing revolutionizes the conventional process of balancing by eliminating the need for balancing holes and balancing weights. Instead, defined laser ablation segments are removed and the uneven mass distribution of the rotor is precisely corrected in the individual balancing planes.

This balancing technology significantly improves the service life of the rotor while reducing the vibration and noise of the pump during operation.

As a pioneer in laser ablation, Pfeiffer Vacuum is able to balance the rotor in the nanogram range.

Improved vibration level

Compared to a turbopump with a conventionally balanced rotor, the HiPace achieves a 20% improvement in the level of vibration. This makes it ideal for use in even the most sensitive applications, such as electron microscopy, RGA systems and mass spectrometry.

Maximum surface cleanliness

The particles produced in the course of laser ablation are extracted and filtered immediately during the process itself. The subsequent cleaning of the laser-balanced rotor and the elimination of manual handling for screw balancing ensure maximum cleanliness of the surfaces. Furthermore, virtual leakages caused by air pockets in the balancing holes are avoided.

The result is the most reliable, low-noise, low-vibration turbomolecular pump on the market.

Comparison of two images from an electron microscope with integrated turbopump:

Larger vibrations (~20 nm) at the high vacuum (HV) flange result in a blurred magnified image.

Smaller vibrations (~5 nm) produce a sharper image.
