

PRODUCT LAUNCH FOR
PROTEIN EXPRESSION MONITORING

Andromeda X

Andromeda X now incorporates Spectral Shift technology to increase the efficiency of your expression optimization screening for recombinant protein targets

ANOTEMPER

**With Andromeda X,
you now have a tool that
helps you optimize
expression of all of your
recombinant proteins.**

**Find the best expression
systems, optimize induction
conditions, and confirm
your recombinant protein is
folded — all before you run
a single SDS-PAGE gel or
chromotagraphy column.**

Andromeda X uses highly sensitive Spectral Shift technology to monitor and optimize expression levels for all of your drug discovery workflows

Antigen production

Enzymatic protein optimization

Small molecule drug target protein expression

Recombinant membrane proteins

**Andromeda X empowers
your protein production
teams**

**Hand over high-quality
recombinant proteins faster**

**Avoid spending time and effort on
re-screening or chasing
unpromising leads by assessing the
stability of proteins early on**

**Get the valuable information
needed to quickly and efficiently
select for conditions that result in
expression of quality proteins**

Andromeda X gives expression insights in less time than traditional SDS-PAGE gels, and provides additional information on the foldedness and functionality of the recombinant proteins.

DR. AMIT GUPTA

HEAD OF PRODUCT MANAGEMENT,
NANOTEMPER TECHNOLOGIES

**Made for protein expression.
Built for momentum.**
